HAZE METER

GONIOPHOTOMETER

## WHY MEASURE GLOSS?

Gloss is an aspect of the visual perception of objects that is as important as colour when considering the psychological impact of products on a consumer.

It has been defined as 'The attribute of surfaces that causes them to have a shiny or lustrous, metallic appearance.'

The gloss of a surface can be greatly influenced by a number of factors, for example the smoothness achieved during polishing, the amount and type of coating applied or the quality of the substrate.

Manufacturers design their products to have maximum appeal: from highly reflective car body panels to glossy magazine covers or matt finish automotive interior trim.

It is important therefore that gloss levels are achieved consistently on every product or across different batches of products.

This is especially noticeable where parts may be produced by different manufacturers or factories but will be placed adjacent to one another to create the finished product.

Gloss can also be a measure of the quality of the surface, for instance a drop in the gloss of a coated surface may indicate problems with its cure, leading to other failures such as poor adhesion or lack of protection for the coated surface.

It is for these reasons that many manufacturing industries monitor the gloss of their products, from cars, printing and furniture to food, pharmaceuticals and consumer electronics.

## **HOW IS GLOSS MEASURED?**

Gloss is measured by shining a known amount of light at a surface and quantifying the reflectance. The angle of the light and the method by which the reflectance is measured are determined by surface and also aspect of the surface appearance to be measured.

## WHICH ANGLE SHOULD I USE FOR MY APPLICATION?

ISO 2813 and ASTM D523 (the most commonly used standards) describe three measurement angles to measure gloss across all surfaces.

Gloss is measured in gloss units (GU) and is traceable to reference standards held at NIST (USA) or NPL (UK).

## Universal Measurement Angle: 60°

All gloss levels can be measured using the standard measurement angle of 60°. This is used as the reference angle with the complimentary angles of 85° and 20° often used for low and high gloss levels respectively.

#### Low Gloss: 85°

For improved resolution of low gloss a grazing angle of 85° is used to measure the surface. This angle is recommended for surfaces which measure less than 10GU when measured at 60°. This angle also has a larger measurement spot which will average out differences in the gloss of textured or slightly uneven surfaces.

#### High Gloss: 20°

The acute measurement angle of 20° gives improved resolution for high gloss surfaces. Surfaces that measure 70GU and above at the standard angle of 60° are often measured with this geometry. The 20° angle is more sensitive to haze effects that affect the appearance of a surface.

## THE ULTIMATE GLOSSMETER UPGRADE

## THE RHOPOINT IQ QUANTIFIES SURFACE QUALITY PROBLEMS THAT ARE INVISIBLE TO A STANDARD GLOSSMETER

The Rhopoint IQ measures reflected image quality; it is the only hand held instrument that profiles how light is reflected from a surface. Glossmeters are usually used to measure the "shininess" of a surface but are not sensitive to common effects which reduce appearance quality.

Orange peel dramatically reduces appearance quality without affecting gloss readings.

These two test panels measure identically with a standard glossmeter.

The Rhopoint IQ with RIQ/DOI measurement can quantify the differences.

Haze is a common problem associated with coatings and polished materials. Surfaces with haze have a "milky" finish with a "shallow" reflected image. This important characteristic is directly measured with the Rhopoint IQ.

## THE RHOPOINT IQ MEASURES

20/60/85° GLOSS • RSPEC • REFLECTANCE HAZE REFLECTED IMAGE QUALITY • DISTINCTNESS OF IMAGE GONIOPHOTOMETRIC CURVES GLOSS – A measurement proportional to the amount of light reflected from a surface.

Geometry: The correct measurement geometry should be used according to the sample finish – matt: 85°, mid gloss: 60°, high gloss: 20°.

RSPEC – The peak gloss measured over a very narrow angle. *Usage:* It is very sensitive to surface texture and can be used to identify subtle differences in smooth surfaces.

REFLECTANCE HAZE – An optical effect caused by microscopic texture or residue on a surface.

Visible Symptoms: A milky finish is apparent on the surface with a loss of reflected contrast. Halos and patterns can be seen around reflections of high intensity light sources.

*Causes:* Poor dispersion, raw material incompatibility, additive migration, vehicle quality, stoving/drying/curing conditions, polishing marks, fine scratches, ageing, oxidisation, poor cleanliness/surface residue.

REFLECTANCE HAZE COMPENSATION

The instrument

The instrument compensates for reflection from within the coating for highly reflective pigments, metallic coatings and speciality pigments, allowing the haze of any painted surface to be measured.

#### REFLECTED IMAGE QUALITY (RIO)

RIQ is used to quantify effects such as orange peel and surface waviness. This new parameter gives higher resolution results compared to Distinctness of Image (DOI) measurement and better mimics human perception of surface texture, especially on high quality finishes such as automotive.

*Symptoms of Poor RIQ*: Orange peel, brush marks, waviness or other structures visible on the surface. Reflected images are distorted.

Causes: Application problems, incorrect coating flow, coating viscosity too high/low, sag or flow of coating before curing, incorrect particle size/distribution, overspray, improper flash/recoat time, inter coat compatibility, incorrect cure times and cure temperature.

#### DISTINCTNESS OF IMAGE (DOI)

A measure of how clearly areflected image will appear in a reflective surface.

## WHY MEASURE HAZE?

Haze can be described as near specular reflection. It is caused by a microscopic surface structure which slightly changes the direction of a reflected light causing a bloom adjacent to the specular (gloss) angle. The surface has less reflective contrast and a shallow milky effect. In the coatings industry, this microscopic surface texture is often due to poorly dispersed raw materials, incompatible raw materials or oxidisation and weathering.

For polished metal surfaces haze is often associated with polishing marks or chemical residue.

## Haze

Haze is light that has been reflected by small surface structures adjacent to the main specular component.

REFLECTANCE HAZE – An optical effect caused by microscopic texture or residue on a surface.

## **REFLECTION HAZE**

Reflection haze is an optical phenomenon usually associated with high gloss surfaces. It is a common surface fault that reduces appearance quality. A hazy surface has a visibly shallower reflection with a milky finish and halos appear around reflections of strong light sources.

Sample 1- No Haze, deep reflection

Sample 2- High Haze, 'shallow' finish

A high gloss finish with haze exhibits a milky finish with low reflective contrast- reflected highlights and lowlights are less pronounced.

Sample 3- Low Haze

Sample 4- Higher Haze

On surfaces with haze, halos are visible around the reflections of strong light sources.

#### Causes of Haze

#### **Coating & Raw Materials**

- Dispersion
- Pigment properties
- Particle size
- Binder compatibility
- Influence and migration of additives
- Resin types and quality

#### Curing

- Drying conditions
- Cure temperature

#### **Post Coating**

- Polishing marks
- Cleanliness
- · Ageing and oxidisation

Haze: Often visible as milky finish on high gloss surfaces

## GLOSS & HAZE MEASUREMENT WITH ARRAY TECHNOLOGY

The Rhopoint IQ uses a 512 element linear diode array which profiles reflected light in a large arc from 14° to 27°. The instrument processes this high resolution data, selecting individual elements within the array that equate to the angular tolerences outlined in international measurement standards.

In a single 20° measurement, the following calculations are made:

$$Gloss = \frac{\sum \text{ Pixels between } 20^{\circ} \pm 0.9^{\circ} \text{ (sample)}}{\sum \text{ Pixels between } 20^{\circ} \pm 0.9^{\circ} \text{ (standard)}}$$

$$\frac{\sum \text{ Pixels from } 17^{\circ} \text{ to } 19^{\circ} \text{ (sample)} +}{\sum \text{ Pixels from } 21^{\circ} \text{ to } 23^{\circ} \text{ (sample)}}$$

$$Haze = 100^{*} \frac{\sum \text{ Pixels from } 21^{\circ} \text{ to } 23^{\circ} \text{ (sample)}}{\sum \text{ Specular Gloss (Standard)}}$$

$$logHaze = 1285(log10((Haze/20) + 1))$$

## **CURVED SURFACE ADJUSTMENT**

A major advantage of the Rhopoint IQ is that it automatically compensates for curved or textured sample surfaces by virtually adjusting the measurement position. Conventional gloss-hazemeters have fixed optics which can make measurement unreliable as any sample curvature will reflect light away from the centre of the measurement sensor causing errors.

The Rhopoint IQ automatically adjusts the sensor position by detecting the peak of the reflected light. The laws of reflection state that the incident angle is equal to the reflection angle thus the peak equates exactly to the 20° gloss angle.

The Rhopoint IQ automatically adjusts for non-flat surfaces by sensing the reflected peak and virtually adjusting the position of the sensor.

## DIFFUSE CORRECTED MEASUREMENT WITH ARRAY TECHNOLOGY\*

Reflection haze is caused by micro texture on a surface which causes a small amount of light to be reflected adjacent to the gloss angle.

For white surfaces, bright colours and metallics, a certain amount of diffuse light, reflected from within the material, is also present in this region.

This diffuse light exaggerates the haze signal for these surfaces causing higher than expected readings.

The Rhopoint IQ compensates for reflection from within the coating for highly reflective pigments, metallic coatings and speciality pigments, allowing the haze of any painted surface to be measured.

## CORRECTED HAZE MEASUREMENT ON METALLIC COATINGS

For non metallic surfaces, the diffuse component is Lambertian: it is equal in amplitude at all angles in relation to the sample surface. Conventional gloss-hazemeters measure diffuse reflection using a luminosity sensor positioned away from the gloss angle. Luminosity is subtracted from the haze signal allowing non metallic surfaces to be measured independently of their colour.

Goniophotometric information profiling the reflection from white, grey and black panels with an identical topcoat.

An advantage of the Rhopoint IQ is that unlike a conventional instrument, compensation is calculated using a region adjacent to the haze angle. This technique gives compatible readings on solid colours but also compensates for directional reflection from metallic coatings and speciality pigments.

The Rhopoint IQ captures compensation information from a region adjacent to the haze measurement angle. This means it can be used on metallic coatings which reflect light directionally.

<sup>\*</sup> Only enabled when the instruments is set to haze measuring mode of ASTM E430

## SAMPLE APPLICATIONS

**Paints and Coatings** 

**Automotive** 

**Printed Cartons** 

Smartphone, Tablet PC and Laptop Covers

**Printing Ink** 

**Yacht Manufacturers** 

**Powder Coating** 

**Plastics Industry** 

**Furniture** 

**Automotive Re-finish** 

**Metal Polishers** 

Aerospace

**Polished Stone** 

Detailing

**Wood Coatings** 

Textile

## THE RHOPOINT IQ IS THE ULTIMATE GLOSSMETER UPGRADE

IQ GLOSS measurements are fully compatible with existing Novo-gloss and Micro-TRI-gloss results.

Dualgloss 20/60° or Trigloss 20/60/85° versions are for maximum accuracy and resolution in all gloss applications.

## **ENHANCED MEASUREMENTS FOR ALL HIGH GLOSS APPLICATIONS**

Paints & Coatings Manufacturers and Applicators

Metal Polishers • Powder Coaters • Plastics Manufacturers

Inks & Printing • Additives Manufacturers • Coil Coaters

Automotive Industry • Wood Coatings • Yacht Manufacturers

Simultaneous measurement of all parameters, date and time stamped.

Displays full statistics for the readings in the current batch.

Graphical reporting for quick trend analysis.

Pass / fail parameters can be defined for instant identification of nonconformances

#### **Goniophotometric Curves**

Different types of surface textures produce identifiably shaped reflectance profile. This goniophotometric data can be downloaded to PC for further analysis and comparison via the USB cable or Bluetooth Data Widget.

## Software-free data transfer

USB connection to PC instantly recognises the device as a drive location which facilitates the quick transfer of .CSV files using Windows Explorer or similar.
